

# Introducing: CarePoint

It's imperative for companies to embrace the "new normal" as we begin to transition back to the workplace. Creating a safe work environment is critical, and the first step toward accelerating organizational goals.

CarePoint provides an undisruptive and touch-free way to protect the wellbeing of your organization. CarePoint includes a patent pending thermal sensor added to your timeclock for the most accurate touch-free temperature reading that works seamlessly with a full range of voice-commanded timeclock actions.

Three hands-free features are available as part of CarePoint to keep your workforce safe and healthy:

## Thermal Temperature Checker

- Checks the employee's temperature without the need for touching a device or another human interaction
- Able to check temperature without removing mask, hats, and/or other protective apparel
- Real time approval or rejection of the employee's temperature displayed on the clock
- Connects seamlessly into the already existing USB port on all NT8000 clocks

## Voice Command

- Touchless workflow that allows employees to fully interact with all essential clock functions with voice
- Improve workplace safety by minimizing contact with devices while still using the hardware
- Addresses shortcomings of facial recognition software for touchless check-in/check-out given that employees may now be wearing masks and other personal protection equipment

## Beacon Bluetooth Technology

- Creates an additional touchless experience by allowing employees to interact with the clock from a distance
- Track employees interactions if an employee tests positive for COVID-19
- Track employees location to support proper social distancing
- Operate with receiver that is built into the NT8000
- Beacons live within employee badges and/or the phone app

Are you ready to arm your workforce with the peace of mind that their health is your top priority?
